

MSCS631_Lab_4

Samrat Baral

Lab 4

University of the Cumberlands

2025 Spring - Advanced Computer Networks (MSCS-631-M40) - Full Term Dr. Yousef Nijim

March 1, 2025

Understanding of Internet Control Message Protocol (ICMP). You will learn to implement a Ping application using ICMP request and reply to messages. See the attached document for full lab instructions.

```

Experience and Challenges:

- Working on this lab assignment was a challenging yet rewarding experience. Implementing a custom Ping application using ICMP in Python pushed me to explore low-level network programming and raw sockets. One of the initial challenges I encountered was dealing with Python 3's handling of bytes, particularly with the checksum function. The error caused by using the `ord()` function on bytes required me to adapt the code, which deepened my understanding of how Python 3 differs from earlier versions. Debugging this issue and ensuring that the ICMP packet headers were correctly structured helped solidify my grasp on network protocols and the nuances of Python's binary data handling.
- Integrating the Python code with a shell script to generate output files for different target hosts across continents was another significant challenge. Running the scripts in a Windows environment using Git Bash required me to adjust command aliases (switching from `python3` to `py -3`) and manage output flushing so that results were saved correctly when the script was terminated by a timeout. Despite these hurdles, the process was invaluable in teaching me cross-platform scripting and troubleshooting in mixed operating environments. Overall, this lab enhanced my technical skills and provided a practical insight into the implementation and debugging of network applications.
